

The Awareness Edge

Volume 1 | Edition 5

May 1, 2026

Featured Focus for the Month

AI-powered scams are becoming more realistic, more personalized, and harder to spot.

Deepfakes, AI-generated phishing, voice cloning, and executive impersonation are now real-world enterprise threats.

The Rise of AI-Powered Cyber Threats

What Scammers Are Doing at Home Today, They'll Try at Work Tomorrow

AI-powered scams are no longer just targeting large companies in fact; they are targeting people at home first. Fake package delivery texts, cloned family voices, deepfake videos, and realistic phishing emails are becoming more common every day.

The same tactics used against individuals are now being used in the workplace to trick employees into sharing information, approving requests, or bypassing security controls.

Today's attackers can use AI to:

- Clone voices from short audio clips
- Create realistic fake videos and deepfakes
- Write highly convincing phishing emails
- Automate social engineering attacks
- Create fake identities and fraudulent documents

If something feels unusual, urgent, or unexpected **always** pause and verify.

AI makes scams look more legitimate than ever before. Taking a few extra seconds to confirm a request, verify a sender, or question unusual behavior can help protect both you and the organization.

Understanding the Art of Deepfake

A deepfake is ai-generated content designed to imitate a real person's voice, appearance, writing style, or behavior — often so convincingly that it can be difficult to tell what's real and what's fake.

Deepfakes can appear in:

- Phone calls
- Video conferences
- Voicemail messages
- Emails and chat platforms

Why it matters

Attackers use deepfakes to build trust, create urgency, and convince people to take action before stopping to verify the request.

Real Attacks. Real Organizations.

A finance employee received a call that sounded exactly like a company executive requesting an urgent wire transfer tied to a confidential business matter. The voice matched the executive's tone, speech patterns, and urgency. Believing the request was legitimate, the employee initiated the transfer before realizing the voice had been cloned using AI.

Common examples include:

- Executive voice fraud used to request urgent payments or sensitive information
- Deepfake video meetings impersonating leaders or trusted contacts
- AI-generated phishing emails that appear polished, personalized, and authentic
- Why It Matters

These attacks are designed to create trust, urgency, and emotional response — increasing the likelihood that someone acts before stopping to verify the request.

Know the Signs of AI Driven-Attacks

- Urgent or high-pressure requests
- Unexpected MFA prompts
- Odd phrasing or communication behavior
- Audio/video irregularities

When Attackers Walk Through the Front Door

Not all social engineering attacks happen through email or ai-generated scams. Many attackers still rely on simple human manipulation techniques to gain physical access to buildings, restricted areas, or sensitive information. This could not only happen at work but also happen at your home.

Physical penetration tests regularly show that people will hold doors open, allow someone to “tailgate” behind them, or trust individuals who appear confident, friendly, or familiar.

Common tactics include:

- Pretending to be IT support, maintenance, or a delivery driver
- Following employees through secured doors without using a badge
- Claiming they “forgot” their access card
- Wearing fake company uniforms or badges
- Creating urgency or using authority to avoid being questioned

Key reminder:

Being polite should never override security procedures.

If someone does not have visible authorization or attempts to bypass normal access controls, politely direct them to the proper process or notify security. One small decision can prevent a major security incident.

Upcoming Events & Awareness Sessions

Cyber threats continue to evolve and staying informed is one of the best ways to protect yourself and the organization. Join our upcoming awareness sessions to strengthen your security knowledge and stay ahead of emerging risks.

Upcoming Topics

- **Data Handling** ([Add to calendar](#))
Learn best practices for protecting sensitive and confidential information.
- **Collaboration Platform Risks** ([Add to calendar](#))
Understand how attackers target tools like Teams, Zoom, Slack, and shared file platforms.
- **Change Management Discipline** ([Add to calendar](#))
Explore how proper change control helps reduce operational and security risk.

Trust your instincts. Verify the unexpected. Protect what matters.
